Extra Online (Time: 30 minutes)

1. Create a procedure that transfers all employees from one department to another, but only those employees whose salary is below the average salary of the target department. Instead of logging in a new table, output each transfer detail (employee_id, old department, new department) using DBMS_OUTPUT.PUT_LINE.

2. Write a BEFORE UPDATE trigger on the HR.EMPLOYEES table that enforces the following rules:

    - If the salary is updated, ensure that the new salary is not decreased by more than 10% compared to the old salary; if it is, raise an exception and prevent the update.

    - If the department_id is changed, verify that the new department exists in the DEPARTMENTS table; if it does not exist, raise an exception.

    - Use :NEW and :OLD as appropriate, and ensure that all these checks and adjustments happen within the same trigger.
