January 2026 CSE 314

Online Assignment on Bash Scripting

Time: 30 minutes

Subsection A2

You are preparing the commentary archive for the World Cup final between Argentina and Spain. Commentary logs from different parts of the match are stored inside `input_dir` and its subdirectories.

Your script must collect the `.log` files in a predictable order and create one combined match report.

Command

```
./online-2205XXX.sh input_dir output_dir
```

Output

1. Create `output_dir` if it does not exist.
2. Search recursively for regular files whose names end with `.log`. Ignore all other files.
3. Sort the selected files alphabetically by their complete paths.
4. Create `output_dir/match_report.txt`. Process the selected files in the alphabetically sorted path order from step 3. For every file, add:

   ```
   ===== original_filename =====
   ```

   Then append the complete contents of that file. Add one blank line after each file's contents.
5. Create `output_dir/file_list.txt`. Add one line for every selected file:

   ```
   original_filename:line_count
   ```

   Sort these lines alphabetically by original filename.
6. Create `output_dir/total_lines.txt` containing only the total number of lines across all selected files.

Sample Input (`input_dir/`)

```
input_dir/
├── first_half/
│   ├── opening.log
│   └── notes.txt
├── second_half/
│   ├── goals.log
│   └── cards.log
└── extra_time/
    └── final_whistle.log
```

Sample Output (`output_dir/`)

```
output_dir/
├── match_report.txt
├── file_list.txt
└── total_lines.txt
```

Contents of `file_list.txt`:

```
cards.log:2
final_whistle.log:1
goals.log:3
opening.log:2
```

Contents of `total_lines.txt`:

```
8
```

Assumptions

- Every selected file has a unique filename.
- At least one `.log` file exists.
