January 2026 CSE 316: Online on Assembly Language

Subsection: C2

Time: 35 minutes + Submission

July 5, 2026

There is an array which contains positive integers. Your task is to:

1. Take the size of the array as input.
2. Take the array elements as input. The number of elements must be equal to the size provided.
3. Take two more inputs: the value to search for and the value to replace it with.
4. Replace every occurrence of the search value with the replacement value.
5. Print the modified array.

You can assume that all inputs, including the size of the array, the array elements, the search value, and the replacement value, consist of a single digit. You have to take these values as user input.

Example 1

Input:

```
5
1 3 5 2 9
5
8
```

Output:

```
1 3 8 2 9
```

Example 2

Input:

```
9
1 3 5 9 3 7 5 9 2
5
0
```

Output:

```
1 3 0 9 3 7 0 9 2
```
