Section C2 — Opponent-Near-Win Penalty

Modify your existing heuristic so that the AI becomes more defensive when the opponent is close to winning.

Let:

$H_{new} = H_{old} - P$

Where:

- P = 15 if the opponent's storage contains at least 40% of the total stones.
- Otherwise, P = 0.

Requirements:

1. Modify the evaluation function to apply the penalty when the opponent is near winning.
2. Run the search on a given initial state.
3. Print:

- Opponent Storage
- Opponent Near Winning: Yes/No
- Penalty Applied
- Selected Move
- Final Evaluation
