Section A1 — Heuristic Based on Near-Winning Condition

Modify your existing evaluation function by adding a near-winning component.

Let:

$H_{new} = H_{old} + W \times (S_m - S_o)$

Where:

- S_m = stones in the current player's storage
- S_o = stones in the opponent's storage
- W is determined dynamically:
- W = 10 if the current player's storage contains at least 40% of the total stones.
- Otherwise, W = 4.

Requirements:

1. Modify your existing heuristic so that the search uses this new dynamic weighting.
2. Print the selected move and its final heuristic/evaluation value.
